

# Evolutionary-Statistical System with Island Model for Forest Fire Spread Prediction

Miguel Méndez-Garabetti, Germán Bianchini,  
María Laura Tardivo and Paola Caymes-Scutari

VI Latin American Symposium on High Performance  
Computing - HPCLatAm 2013

# Organization

- 1 Introduction
  - Models in Forest Fire Spread Prediction
  
- 2 Prediction Methods
  - Classification
  - Classical Prediction
  - Data Driven
  
- 3 Evolutionary-Statistical System with Island Model
  - ESS and ESS-IM
  - Communication and population treatment
  - CS-Monitor: three different alternatives
  
- 4 Conclusions and future work

# Models

## Models

The use of models to represent different physical systems is a common practice in various areas of science.

## Models

The use of models to represent different physical systems is a common practice in various areas of science.

Schema of a general model

# Models

## Limitations and difficulties:

When the systems that implement the models are fed with fixed values that represent dynamic parameters.

Schema of a general model

# Models

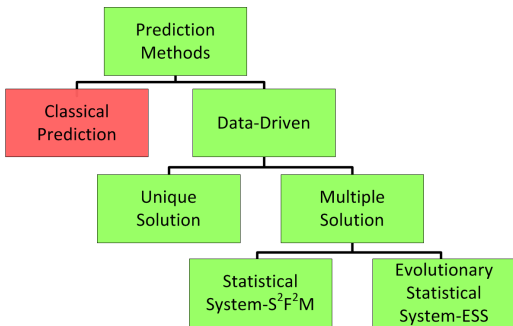

In fire predictions models:

Some input parameters must be estimated from indirect measurements, generating a prediction distant from reality.

## Evolutionary-Statistical System

Uncertainty reduction method based on the use of PEAs, Statistics and HPC.

# ESS-IM

## Objective:

To increment the parallelism level of the ESS method by including the Island Model in the Parallel Evolutionary Algorithm (PEAs), and verify if some improvement in the quality of the prediction of ESS is reached.

Evolutionary  
Statistical  
System-ESS

Two versions of ESS: 1) Unique Population and 2) Multiple Populations

# ESS-IM

## Objective:

To increment the parallelism level of the ESS method by including the Island Model in the Parallel Evolutionary Algorithm (PEAs), and verify if some improvement in the quality of the prediction of ESS is reached.

# CS-Monitor, different criteria

CS-Monitor: Calibration Stage in Monitor Node

# CS-Monitor, different criteria

CS-Monitor: Calibration Stage in Monitor Node

- 1 The best  $K_{ign}$  of all islands.

# CS-Monitor, different criteria

CS-Monitor: Calibration Stage in Monitor Node

- 1 The best  $K_{ign}$  of all islands.
- 2 To calculate just one  $K_{ign}$  based on statistical map that aggregates the statistical maps of each population.

# CS-Monitor, different criteria

CS-Monitor: Calibration Stage in Monitor Node

- 1 The best  $K_{ign}$  of all islands.
- 2 To calculate just one  $K_{ign}$  based on statistical map that aggregates the statistical maps of each population.
- 3 The  $K_{ign}$  that is firstly found could be considered.

# CS-Monitor, different criteria

CS-Monitor: Calibration Stage in Monitor Node

- 1 The best  $K_{ign}$  of all islands.
- 2 To calculate just one  $K_{ign}$  based on statistical map that aggregates the statistical maps of each population.
- 3 The  $K_{ign}$  that is firstly found could be considered.

Due to the existence of the different mentioned alternatives:

We will conduct a detailed comparison of these options.

## Conclusions and future work

There are many issues to be considered:

- The different ways to implement the statistical method.
- The different alternatives for implementing the Fire Prediction stage.
- The influence of different migration strategies.
- The possibilities of communication topologies.

Future Work:

Further study should focus on the analysis and tuning of the method to obtain the best possible results and compare it with other existing methods.

**Thanks for your attention!**
